

Connection of collectors and accessories

For the connection of two and three collectors to each other you must use the bronze connecting raccords as shown in the diagrams. The bronze plugs 1/2" are connected diagonally on the collector(s).

The bronze cross, the degasser and the sensor socket are connected to the outlet on the highest point of the collector(s) as shown in the photo.

In order to achieve the best contact between the the sensor and the sensor socket, use thermal conductive material before connecting.

The above accessories are found in a plastic bag which is included in the accessories box.

The sensor socket (1) of length 135mm is connected to the boiler, while the small sensor socket (2) of length 65mm is connected to the collectors.
